

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Currently Amended) Container usable as a working space with a variable volume, comprising:

a floor wall, a roof wall and at least one side wall that is foldable about a horizontal axis;

at least one expansion element that is movable out of the container, the at least one expansion element having a floor wall, a side open to the container and a front wall situated opposite the open side and being in a permanently fixed position relative to the floor wall, and being open toward a top thereof, and, in a moved-out condition, a roof wall of the at least one expansion element being formed by an associated folded-open side wall of the container;

a lifting device ~~configured as~~ including a cable winch assigned to the at least one expansion element for lowering the at least one expansion element such that, after moving of the expansion element out of the container, an upper surface of the floor wall of the moved-out expansion element and an upper surface of the floor wall of the container are situated at the same level, and for lifting the at least one expansion element such that, after lowering, the expansion element is movable back into the container; wherein the lifting device is configured to be active between the folded-open side wall and an expansion element,

~~wherein tracks are provided on the at least one foldable side wall to guide the at least one expansion elements via rollers when moving out of or into the basic container, and~~

~~a cable of the cable winch is guided by guide rollers, a first group of the guide rollers being arranged on the at least one expansion element, and a second group of the guide rollers being arranged on traveling carriages guided in the track by via the rollers.~~

wherein tracks are provided on the at least one foldable side wall to guide the at least one expansion element, and

a first group of rollers being operatively associated on the traveling carriages for moving the at least one expansion element out of or into the container along the tracks, and a second group of rollers being operatively associated on the traveling carriages with a cable of the cable winch for lifting and lowering the at least one expansion element, wherein the traveling carriages are slidably positioned in the tracks via the first group of rollers, and guided in the tracks via the first group of rollers.

2. **(Previously Presented)** Container according to Claim 1, wherein the container has two foldable side walls and two expansion elements that are movable out of the container in opposite directions from each other, the dimensions of the expansion elements being selected such that one expansion element is movable into the other expansion element, and a lifting device is

associated with each expansion element to be effective between a folded-open side wall and an expansion element.

3-5. **(Canceled)**

6. **(Previously Presented)** Container according to Claim 1, wherein guiding devices for guiding the at least one expansion element during the lifting and lowering movement are arranged on the traveling carriages.

7. **(Previously Presented)** Container according to Claim 1, wherein the cable winch assigned to the at least one expansion element comprises two cables associated with one of two expansion elements so as to be windable off or on by a common drive.

8. **(Previously Presented)** Container according to Claim 1, wherein surface elements are provided to close gaps between the at least one expansion element and the associated folded open side wall resulting from the lowering of the at least one expansion element, whereby an interior space is created which is completely closed off toward the outside of the container.

9. **(Original)** Container according to Claim 8, wherein the surface elements have a multi-shell construction.

10. **(Previously Presented)** Container according to Claim 9, wherein a shell of the multi-shell surface element is provided for a gap between the front wall and the foldable side wall of the container and is rigidly fastened to the foldable side wall.

11. **(Withdrawn)** Container according to Claim 8, wherein the surface elements are foldable away from the associated foldable side wall of the basic container.

12. **(Withdrawn)** Container according to Claim 11, wherein the surface elements have a multi-shell construction.

13. **(Original)** Container according to Claim 8, wherein the surface elements are provided at a side wall of the at least one expansion element and are vertically movable with respect to the side wall.

14. **(Original)** Container according to Claim 13, wherein the surface elements have a multi-shell construction.

15. **(Previously Presented)** Container according to Claim 13, wherein when the at least one expansion element is moved out of the container, the surface elements are guided in a path arranged at a track.

16. **(Currently Amended)** Container according to Claim 8, wherein seals are provided for sealing between the surface elements and the expansion element ~~[[or]]~~ of the container.

17. **(Original)** Container according to Claim 16, wherein the surface elements have a multi-shell construction.

18. **(Previously Presented)** Container according to Claim 17, wherein a shell of the multi-shell surface element is provided for a gap between the front wall and the foldable side wall of the container and is rigidly fastened to the foldable side wall.

19. **(Previously Presented)** Container according to Claim 16, wherein the surface elements are foldable away from the associated foldable side wall of the container.

20. **(Original)** Container according to Claim 16, wherein the seals are at least one of sliding and contact seals.
